COMMENT

requests: clonerequest@sanger.ac.uk
On Jul 8, 2001 this sequence version replaced gi:14575291.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred*quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP
database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               * NOTE: This is a 'working draft' sequence. It currently consists of 24 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dodge,S., Domino,M.,

* consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Center project name: L2916

The protein is used to control and participate in gene expression, by acting as transcriptional activator, strictly dependent on the presence of an intact E box (CANNTG), particularly for targeting expression of proteins to the central nervous system (CNS). The nucleic acid sequence can be used to treat nervous system disorders, and antisense sequences can be used to control mRNA transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Basic helix-loop-helix polypeptide and related nucleic acid transcriptional activity, for targeting expression of genes central nervous system and treatment of nervous disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1491
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Local Simi

The Ngn3 gene is located at chromosome position 10q22.1-22. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor, the method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an islet cell precursor. The Ngn3 DNA sequence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in pancreatic islet cell function or formation associated with a defect in Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell precursor cells expressing Ngn3, and to alter cellular differentiation in culture in vivo to produce new beta-cells to treat patients with diabetes mellitus. The present sequence represents the murine Ngn3 genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human neurogenin 3 polypeptides and polynucleotides encoding them, useful for diagnosis, prevention and treatment of diabetes mellitus and to identify individuals at risk of diabetes -

The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful for treating type 2 diabetes mellitus and for replacing beta cells lost to autoimmune destruction in individuals with type 1 diabetes. The method is useful for cell in cell therapy. The present sequence is murine neurogenin 3 means force.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mus

                                                                                                                                                                                                                                                                                                                                    The invention relates to the use of atomal-associated nucleic acid or CC amino acid sequence, or any of its homologues or orthologues as CC therapeutic agents for the treatment of deafness, partial hearing loss, CC vestibular effects due to damage or loss of inner hair cells, CC vestibular effects due to damage or loss of inner hair cells, CC encompasses methods of screening for compounds which affect the CC encompasses methods of screening for compounds which affect the CC expression of an atomal-associated nucleic acid sequence, in an animal, CC and a transgenic animal in which an allele of a native atomal-associated CC gene is replaced by a heterologous nucleic acid sequence, thus CC inactivating the atomal-associated allele. The nucleic acids or proteins CC may be used in a method of treating an animal for hearing impairment, CC disease related to loss of a functional atomal-associated nucleic acid or protein. They may particularly be used to treat an animal with a CC deficiency in cerebellar granule neurons or their precursors, and may CC also be used in promoting mechanoreceptive cell growth and generating CC acid sequence referred to in the invention.

CC Note: The present sequence represents an atomal-associated nucleic acid sequence referred to in the invention.
                                                                                                                                                                                                                                      Matches

                                                                                                                                Ś
                                                                                                                                                                   В
                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                         The invention relates to the use of atomal-associated nucleic acid or CC amino acid sequence, or any of its homologues or orthologues as CC therapeutic agents for the treatment of deafness, partial hearing loss, CC vestibular effects due to damage or loss of inner hair cells, CC osteoarthritis and abnormal cell proliferation. The invention also CC encompasses methods of screening for compounds which affect the CC expression of an atomal-associated nucleic acid sequence in an animal, CC and a transgenic animal in which an allele of a native atomal-associated gene is replaced by a heterologous nucleic acid sequence, thus CC inactivating the atomal-associated allele. The nucleic acids or proteins CC may be used in a method of treating an animal for hearing impairment, CC disease related to loss of a functional atomal-associated nucleic acid or CC disease related to loss of a functional atomal-associated nucleic acid or CC disease related to loss of a functional atomal-associated nucleic acid or CC disease related to loss of a functional atomal-associated nucleic acid sequence referred to in the invention.

CC also be used in promoting mechanoreceptive cell growth and generating CC hair cells. The present sequence represents an atomal-associated nucleic acid sequence referred to in the invention.
                                                                                                                                                                                                                                     Best Local Sim

a gene which is required for the specification of the early endocrine which is required for the specification of the early endocrine precursor in the pancreatic epithelium and which is down-regulated once endocrine differentiation begins. The invention provides a claimed method for differentiating stem cells (especially embryonic, adult or somatic stem cells and primordial germ cells) into insulin-producing cells. This involves culturing stem cells in a suitable medium and activating at least one gene involved in beta-cell differentiation. Preferred genes including Pdx1, Pax4, Pax6 and ngn3 (see ABVT5967-70). Gene activation comprises the cells end ngn3 (see ABVT5967-70). Gene activation comprises the system, or the delivery of a protein product of the gene into stem cells. The insulin-producing cells can be transplanted into animals or human for treatment of pancreatic diseases, metabolic syndrome and metabolic disorders with impaired glucose levels such as diabetes, hyperglycaemia and impaired glucose tolerance (claimed). The cells can also be used to identify compounds which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The cells can also be used to recommend or glucose stimulate beta-cell differentiation, insulin secretion or glucose responsiveness. Differentiated beta-cells can be used to study the toxic and other effects of exogenous compounds on beta-cell function. In an example from the invention, Pax6 cDNA was inserted function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of cDNA encoding the murine basic helix-loop-helix transcription factor neurogenin 3 a gene which is required for the specification of the ea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Differentiating stem cells into insulin-producing cells useful for treating pancreatic diseases, by culturing stem cells in suitable medium and activating gene involved in beta-cell differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 861

The neurogenin nucleic acids can be expressed a host cell, transformed using an expression vector, to produce combinant proteins. The proteins and the antibodies raised against e proteins are useful in the study of neurogenesis.

Claim 1; Fig 1J; 76pp; English.

The patent discloses a method for inducing non-neuronal cells (NNC) to differentiate into neurons and for NNCs to express a neuronal subtype CC differentiate into neurons and for NNCs to express a neuronal subtype CC especific marker. Transformed host cells are used as sources of neuronal CC and other growth factors; in culture for screening compounds that CC modulate neural differentiation or as sources of recombinantly produced CC neurogenins and phox2a proteins for use in transplantation. The cells CC also have a variety of in vivo uses, e.g. for transplantation at sites of CC neuronal dysfunction e.g. patients with hearing or vision loss due to CC optical or auditory nerve damage, brain or spinal cord injuries, and CC neurodegenerative disorders e.g. Alzheimer's disease. The present CC sequence encodes murine neurogenin-3 (NGN-3), a transcription factor. CC NNCs differentiate into neurons through the recombinant expression of a CC transcription factor that induces a core program of neurogenesis. Forced CC expression of murine NGN3 can ellcit expression of at least some neuronal vy

The Ngn3 gene is located at chromosome position 10022.1-22.2. The invention relates to the human Ngn3 nucleotide and protein sequences, and includes an antibody recognising the Ngn3 protein. Also included in the invention is a method for identifying an islet cell precursor, the method involves analysing a cell for the expression of the Ngn3 gene product, where detection of the product is indicative of an islet cell precursor. The Ngn3 DNA sequence is useful as a diagnostic reagent for detecting (in a subject) a predisposition to a defect in pancreatic islet cell function or formation associated with a defect in Ngn3 activity. The Ngn3 protein is useful for identifying beta-cell precursor cells expressing Ngn3, and to alter cellular differentiation in culture in vivo to produce new beta-cells to treat patients with diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         them, useful mellitus and

The invention relates to a method for producing a mammalian islet cell. The method comprising introducing into a mammalian cell a nucleic acid molecule encoding an islet transcription factor for expression of the islet transcription factor in the cell and for production of islet cell phenotype in the cell. The islet transcription factor is a neuroendocrine basic helix-loop-helix (bHLH) transcription factor. The method is useful for treating type 2 diabetes mellitus and for replacing beta cells lost to autoimmune destruction in individuals with type 1 diabetes. The method is useful in cell therapy. The present sequence is human neurogenin 3 (Ngn3) gene. Ngn3 gene is located on chromosome 10q22.1-22.2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g a mammalian islet cell for treating diabetes mellitus s introducing into a mammalian cell a nucleic acid moleoneuroendocrine basic helix-loop-helix transcription fac

                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                    Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CC The amplicon is hybridised to two classes, each with at least one CC member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the CC lasses of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide cystems etc., particularly by detecting mutations or single nucleotide cypes and for investigating cell differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously.

CC ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in

                                                                                                                                                                                           This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CC The amplicon is hybridised to two classes, each with at least one CC member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the CC lasses of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of CC is used: (1) for diagnosis and/or prognosis of side effects of CC is used: (1) for diagnosis and/or prognosis of side effects of CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide collymorphisms (SNP's), and (ii) for differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously.

CC AB013410-AB054121 represent genomic DNA sequences used to illustrate the method of colling the degree of cytosine methylation described in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC Cytosine (C) but not methylated C, to uracil, then part of the genomic CC DNA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one CC member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the CC lasses of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of CC classes of oligomers, the degree of methylation is calculated. The method CC is used: (i) for diagnosis and/or prognosis of side effects of CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC of the central nervous, cardiovascular, gastrointestinal and respiratory CC systems etc., particularly by detecting mutations or single nucleotide CC types and for investigating cell differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously. CR ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the CC method for determining the degree of cytosine methylation described in CC the disclosure of the invention.
